Claims

- 1. A process for removal of impurities from Nitric Oxide gas, for a research, industrial, semiconductors, medical, and analytical application, comprising: (a) providing a mixture of Nitric Oxide and its common impurities, (b) passing this gaseous mixture trough a first filter composed by a mixture of hydroxides of alkali and earth alkali metals, (c) passing the mixture through a second filter system, (d) collecting the purified gas in a sealed delivery tank.
- 2. The process for removal of impurities according to claim 1, further comprising: maintaining the temperature of said first filter between 50 and 298 degrees Kelvin.
- 3. The process for removal of light impurities according to claim 2, further comprising: maintaining a pressure between 0.1 and 1000 atmospheres inside said delivery tank.
- 4. The process for removal of impurities according to claim 1, further comprising: retaining impurities in said first filter and in said second filter.
- 5. The process for removal of impurities according to claim 1, wherein the impurities are selected from a group comprising nitrogen dioxide (NO₂), sulfur dioxide (SO₂), sulfur trioxide (SO₃), methane (CH₄), oxygen (O₂), carbon monoxide (CO), and carbon dioxide (CO₂), ozone (O₃), water (H₂O), ammonia (NH₃), nitrous oxide (N₂O) and volatile hydrocarbons.
- 6. The process for removal of impurities according to claim 1 where the mixture of hydroxides of alkali and earth alkali metal inside said filter 1 contains ASCARITE (registered trademark).
- 7. The process for removal of impurities from nitric oxide according to claim 1 where the mixture of hydroxides of alkali and earth alkali metals contains sodium hydroxide.

- 8. The process for removal of impurities from nitric oxide according to claim 1 where the mixture of hydroxides of alkali and earth alkali metals contains anyone of the following compounds: sodium hydroxide, barium hydroxide, calcium hydroxide, lithium hydroxide, magnesium hydroxide, potassium hydroxide, strontium hydroxide, cesium hydroxide, francium hydroxide, and silica dioxide.
- 9. The process for nitric oxide purification according to claim 1, wherein said mixture of hydroxides of alkali and earth alkali metals is replaced upon depletion.
- 10. The process for nitric oxide purification according to claim 1, wherein said second filter contains a molecular sieve.
- 11. The process for nitric oxide purification according to claim 1, wherein said second filter is regenerated by flushing a dry gas and by heat.
- 12. The process for nitric oxide purification according to claim 1, wherein said nitric oxide conveyed to said delivery tank has a percentage of impurities between 0 % and 1 %.
- 14. An apparatus for removing impurities from a nitric oxide comprising: (a) a tank of impure nitric oxide, said tank having a first end and a second end; (b) a first inert tubing system connecting said first end of said tank to a first filter-pack, (c) a needle valve to regulate the gas flow trough the filtering system, (d) a first filter-pack, (e) a second inert tubing system connecting said filter-pack to a second filter-pack, (f) a second filter-pack, (g) a third inert tubing system delivering the purified nitric oxide to a delivery tank, (h) a delivery tank.
- 15. The apparatus for removing impurities from a nitric oxide gas according to claim 14, further comprising: a refrigeration unit integral with or separate from said first filter in order to maintain said first filter at a temperature between 50 and 298 degrees Kelvin.
- 16. The apparatus for removing impurities from a nitric oxide gas according to claim 14, comprising a vacuum pump.
- 17. The apparatus for removing impurities from a nitric oxide gas according to claim 14, wherein said second filter

pack is a molecular sieve.

- 18. The apparatus for nitric oxide purification, according to claim 14, wherein said first filter comprises silica dioxide supporting a hydroxide of an alkali or earth alkali metal.
- 19. The apparatus for removal of impurities according to claim 14, further comprising a tubing system internally coated with an inert material to avoid any reaction between the gas mixture and its internal surface. Said tubing system connecting all the elements of the apparatus.
- 20. An apparatus for filtering out impurities from nitric oxide comprising (a) a support of silica dioxide, (b) at least one hydroxide of alkali or earth alkali metals, (c) a box having inert interior surfaces and two openings, (d) a cooling system to cool down the temperature of the impure NO flow, (e) a metal filter-net to easy the deposition of the impurities.
